Software Engineer

San Francisco, CA • [LinkedIn](#) • [GitHub](#)

SUMMARY

Full-stack engineer building AI-driven web applications and LLM-powered interfaces. Experienced in RAG chat systems, real-time streaming UIs, and evaluation dashboards that bridge front-end design with intelligent back-end logic. Focused on writing performant, maintainable, production-ready code and shipping systems that hold up under real-world use.

KEY SKILLS

Data Tools/Back-End: Redis, Node.js, Express, PostgreSQL, MongoDB, Firebase, Python, Matplotlib, AWS

AI Orchestration: OpenAI, Anthropic, Langchain, Langfuse, Unstructured

Front-End: TypeScript, JavaScript, Next.js, React, React Router, Framer Motion, Tailwind, MUI, Jest, Vitest, Git, HTML, CSS

WORK EXPERIENCE

Code the Dream, Full-Stack Developer

11/2024 – Current

- Present the AI pipeline to non-technical stakeholders — how retrieval works, what cosine similarity means, why citations can be trusted — including a deployed artifact bundle built for a state pilot team

Front-End Development:

- Moved production chat interfaces to Next.js Server Components, measuring the win before committing the team — cut client-side bundles and load times by 30% through server-side data fetching and streaming

Back-End Development, Database Management, AI Engineering:

- Took a Node/Next.js AI platform onto the full Azure tandem for a state government deployment — Azure OpenAI + embeddings, AI Language for PII, Cache for Redis, CosmosDB — validating each service against its non-Azure twin
- Built a LangGraph RAG route with sentence-level citation validation, bounded retries, and checkpointed multi-turn memory — cut the pipeline's unanswered-question rate in half, to 6.1%, in replayed-production benchmarks
- Lead the LangGraph workstream on a state-deployed AI platform — ~94% of answers carry a validated citation
- Broke a monolithic 853-line admin eval page into modular components across a 132-file refactor, then killed its infinite-loading and broken-back-button bugs with per-component loading states
- Established capacity ahead of a state pilot — bottleneck isolated to the app tier (p95 1.4s at 300 users)
- Cut npm vulnerabilities ~50 → ~15 and standardized dependency updates via grouped Dependabot policy

SELECTED TECHNICAL PROJECTS

Hackathon Project: [Chef Jul](#), Full-Stack Developer | [GitHub](#)

- Won 2nd Place (MetLife Hackathon 2025) as Team Lead, spearheading the architecture and deployment of an AI meal-planning assistant from concept to a production-ready Firebase backend in <48 hours
- Solved high-latency bottlenecks by architecting a parallelized generation pipeline, reducing total processing time by 40% to sub-55s execution under constrained hardware
- Orchestrated a multi-agent "Split-Brain" workflow that decoupled heavy recipe generation from rapid contextual tweaks, enabling near-instant (~2s) user preference adjustments via shared state synchronization

Personal Project: [VanLife](#), Full-Stack Developer | [GitHub](#)

- Built a Node.js/Express API with JWT auth middleware, centralized error handling, and security middleware (helmet, rate limiting, split CORS for public vs credentialed routes)
- Built JWT auth middleware with httpOnly cookies, session-expiry handling, and granular route protection for public vs credentialed API routes

Personal Project: [Portfolio](#), Full-Stack Developer | [GitHub](#)

- Built the site test-first — unit test before each component, E2E spec before each flow — landing at 280+ unit and 46 end-to-end tests, with error states and loading states tested, not just happy paths
- Published a methodology for portable AI-agent behavior across repos — an always-on principles layer, per-repo rules, and twelve event-triggered skills — addressing context rot and false confidence in agent workflows
- Built a production AI chat with Vercel AI SDK v6 — streaming, tool calls (live calendar scheduling, bio lookup), multi-provider failover — with every tool state (pending, success, error) rendered distinctly in the UI

EDUCATION

React, Node.js, Python and Advanced Practicum | Code the Dream Certificate

Software Engineer Immersive Program | Hack Reactor

Bachelor of Arts in International Affairs | Kyiv International University

2024

2018
